CS 5343: Assignment 2

Question 1: Majority Element

Given an array `nums` of size n , return the majority element.

The majority element is the element that appears more than $\lfloor n / 2 \rfloor$ times. You may assume that the majority element always exists in the array.

Example 1:

Input: `nums = [3,2,3]`

Output: 3

Example 2:

Input: `nums = [2,2,1,1,1,2,2]`

Output: 2

Constraints:

$n == \text{nums.length}$

$1 \leq n \leq 5 * 10^4$

$-10^9 \leq \text{nums}[i] \leq 10^9$

Code

```
/* Topic: Arrays
 * Question: Majority Element * Given an array nums of size n, return the majority
element. * The majority element is the element that appears more than  $\lfloor n / 2 \rfloor$  times.
 * You may assume that the majority element always exists in the array. */
#include <iostream>
#include <vector>

using namespace std;
```

```

int majorityElement(vector<int>& nums) {

    int ME;
    int me_count = 1;
    int n = nums.size();

    ME = nums[0];

    for(int i = 1; i < n; i++){

        if(me_count == 0){
            ME = nums[i];
            me_count = 1;
        }
        else{
            if(nums[i] == ME){
                me_count++;
            }
            else{
                me_count--;
            }
        }

    }

    return ME;
}

int main() {
    vector<int> arr = { 1, 1, 2, 1, 3, 5, 1 };

    // Function calling
    cout<<"The majority element is "<<majorityElement(arr);
    return 0;
}

```

Output

```

/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
The majority element is 1
Process finished with exit code 0

```

Question 2: Longest Consecutive Sequence

Given an unsorted array of integers `nums`, return the length of the longest consecutive elements sequence.

You must write an algorithm that runs in $O(n)$ time.

Example 1:

Input: `nums = [100,4,200,1,3,2]`

Output: 4

Explanation:

The longest consecutive elements sequence is `[1, 2, 3, 4]`. Therefore its length is 4.

Code

```
/* Topic: Hashing
 * Question: Longest Consecutive Sequence * Given an unsorted array of integers
nums, return the length of the longest consecutive elements sequence. * You must
write an algorithm that runs in O(n) time. */
#include <iostream>
#include <vector>
#include <unordered_set>

using namespace std;

int longestConsecutive(vector<int>& nums) {

    int maxcount = 0;
    int ele;

    if(nums.size() == 0){
        return 0;
    }

    int count = 0;
    unordered_set<int> hset;

    //Insert elements in hash set
    for(int i = 0; i < nums.size(); i++){
        hset.insert(nums[i]);
    }

    //Check for consecutive sequence
```

```

    for(int i = 0; i < nums.size(); i++){

        ele = nums[i];

        if(hset.find(ele - 1) == hset.end()){

            count = 1;

            while(hset.find(ele + 1) != hset.end()){
                count++;
                ele++;
            }

        }

        maxcount = max(maxcount, count);
    }

    return maxcount;
}

int main()
{
    vector<int> arr = { 1, 9, 3, 10, 4, 20, 2, 5, 11 };
    cout << "Length of the Longest contiguous subsequence "
         << "is " << longestConsecutive(arr);
    return 0;
}

```

Output

```

/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
Length of the Longest contiguous subsequence is 5
Process finished with exit code 0

```

Question 3: Linked List Cycle

Given head, the head of a linked list, determine if the linked list has a cycle in it.

There is a cycle in a linked list if there is some node in the list that can be reached again by continuously following the next pointer. Internally, pos is used to denote the index of the node that tail's next pointer is connected to. Note that pos is not passed as a parameter.

Return true if there is a cycle in the linked list. Otherwise, return false.

Example:

Input: head = [3,2,0,-4], pos = 1

Output: true

Explanation: There is a cycle in the linked list, where the tail connects to the 1st node (0-indexed).

Code

```
/* Topic: Linked Lists
 * Question: Linked List Cycle * Given head, the head of a linked list, determine
if the linked list has a cycle in it. * Return true if there is a cycle in the
linked list. Otherwise, return false. */#include <iostream>
#include <vector>

using namespace std;

struct ListNode {
    int val;
    ListNode *next;
    ListNode(int x) : val(x), next(NULL) {}
};

void push(struct ListNode** head_ref, int new_data)
{
    /* allocate node */
    struct ListNode* new_node = new ListNode(new_data);

    /* link the old list off the new node */
    new_node->next = (*head_ref);

    /* move the head to point to the new node */
    (*head_ref) = new_node;
}

bool hasCycle(ListNode *head) {
```

```

    ListNode* fast;
    ListNode* slow;

    fast = head;
    slow = head;

    while(fast != NULL && fast -> next != NULL){
        slow = slow -> next; //Move slow pointer by 1
        fast = fast -> next -> next; //Move fast pointer by 2

        if(slow == fast){
            return true;
        }

    }

    return false;
}

int main(){
    ListNode* head = new ListNode(4);

    push(&head, 20);
    push(&head, 5);
    push(&head, 15);
    push(&head, 10);

    head->next->next->next->next = head;

    if(hasCycle(head))
        cout<<"Loop found"<<endl;

    else
        cout<<"No Loop"<<endl;

    return 0;
}

```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
```

```
Loop found
```

```
Process finished with exit code 0
```

Question 4: Remove Nth Node From End of List

Given the head of a linked list, remove the nth node from the end of the list and return its head.

Example:

Input: head = [1,2,3,4,5], n = 2

Output: [1,2,3,5]

Code

```
/* Topic: Linked Lists
 * Question: Remove Nth Node From End of List * Given the head of a linked list, *
remove the nth node from the end of the list and return its head. */
#include <iostream>
#include <vector>

using namespace std;

struct ListNode {
    int val;
    ListNode *next;
    ListNode() : val(0), next(nullptr) {}
    ListNode(int x) : val(x), next(nullptr) {}
    ListNode(int x, ListNode *next) : val(x), next(next) {}
};
```

```

ListNode* removeNthFromEnd(ListNode* head, int n) {

    ListNode* slow = head;
    ListNode* fast = head;
    ListNode* dummy = new ListNode(0, head);

    if(head -> next == NULL){
        return NULL;
    }

    while(n > 0 && fast != NULL){
        fast = fast -> next;
        n--;
    }

    //If we reached null, it means n = number of nodes in the list, so delete
    //first node
    if(fast == NULL){
        head = head -> next;
        return head;
    }

    //move the two pointers till we reach the end of the list
    while(fast->next != NULL){
        fast = fast -> next;
        slow = slow -> next;
    }

    slow -> next = slow -> next -> next;

    return head;
}

int main(){

    return 0;
}

```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
0 1 2 3 4 5
0 1 2 4 5
Process finished with exit code 0
```

Question 5: Kth Largest Element in a Stream

Design a class to find the kth largest element in a stream. Note that it is the kth largest element in the sorted order, not the kth distinct element.

Implement KthLargest class:

KthLargest(int k, int[] nums) Initializes the object with the integer k and the stream of integers nums.

int add(int val) Appends the integer val to the stream and returns the element representing the kth largest element in the stream.

["KthLargest", "add", "add", "add", "add", "add"]

[3](#), [4](#), [5](#), [8](#), [2](#), [3], [5], [10], [9], [4]]

Output

[null, 4, 5, 5, 8, 8]

Code

```
/* Topic: Heaps/Priority Queues
 * Question: Kth Largest Element in a Stream * Design a class to find the kth
largest element in a stream. * Note that it is the kth largest element in the
sorted order, not the kth distinct element. */
#include <iostream>
#include <vector>
#include <queue>

using namespace std;

class KthLargest {
public:
    KthLargest(int k, vector<int>& nums) {
        this->k = k;

        for(int i = 0; i < nums.size(); i++){
            pq.push(nums[i]);
```

```

    }
    while(pq.size() > this -> k){
        pq.pop();
    }
}

int add(int val) {
    pq.push(val);

    if(pq.size() > k){
        pq.pop();
    }
    return pq.top();
}

private:
    int k;
    priority_queue<int, vector<int>, greater<int>> pq;
};

int main(){
    int k = 3;
    vector<int> nums = {4, 5, 8, 2};
    KthLargest* obj = new KthLargest(k, nums);

    int param_1 = obj->add(10);
    cout<<"Kth Largest Value after adding 10: "<<param_1<<endl;
    int param_2 = obj->add(15);
    cout<<"Kth Largest Value after adding 15: "<<param_2<<endl;

    return 0;
}

```

Output

```

/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
Kth Largest Value after adding 10: 5
Kth Largest Value after adding 15: 8

Process finished with exit code 0

```

Question 6: Convert Sorted Array into Binary Search Tree

Given an integer array `nums` where the elements are sorted in ascending order, convert it to a height-balanced binary search tree.

Input: `nums = [-10,-3,0,5,9]`

Output: `[0,-3,9,-10,null,5]`

Explanation: `[0,-10,5,null,-3,null,9]` is also accepted:

Code

```
/* Topic: Search Trees
 * Question: Convert Sorted Array into Binary Search Tree * Design a class to find
the kth largest element in a stream. * Note that it is the kth largest element in
the sorted order, not the kth distinct element. */
#include <iostream>
#include <vector>

using namespace std;

struct TreeNode {
    int val;
    TreeNode *left;
    TreeNode *right;
    TreeNode() : val(0), left(nullptr), right(nullptr) {}
    TreeNode(int x) : val(x), left(nullptr), right(nullptr) {}
    TreeNode(int x, TreeNode *left, TreeNode *right) : val(x), left(left),
right(right) {}
};

TreeNode* buildBST(vector<int>& A, int l, int r){

    if(l > r){
        return NULL;
    }
    int mid = r -(r - l)/2;
```

```

        TreeNode* root = new TreeNode(A[mid]);

        root->left = buildBST(A, l, mid-1);
        root->right = buildBST(A, mid + 1, r);

        return root;
    }

    TreeNode* sortedArrayToBST(vector<int>& nums) {

        return buildBST(nums, 0, nums.size()-1);
    }

    void printPreorder(TreeNode* root){

        if(root == NULL){
            cout<<" null";
            return;
        }

        cout<<" "<<root -> val;

        printPreorder(root->left);
        printPreorder(root->right);
    }

    int main() {
        vector<int> nums = {-10, -3, 0, 5, 9};

        TreeNode *mytree = new TreeNode();
        mytree = sortedArrayToBST(nums);
        cout<<"Preorder Traversal:"<<endl;
        printPreorder(mytree);

        return 0;
    }

```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
Preorder Traversal:
0 -3 -10 null null null 9 5 null null null
Process finished with exit code 0
```

Question 7: Rotate Array

Given an array, rotate the array to the right by k steps, where k is non-negative.

Input: nums = [1,2,3,4,5,6,7], k = 3

Output: [5,6,7,1,2,3,4]

Explanation:

rotate 1 steps to the right: [7,1,2,3,4,5,6]

rotate 2 steps to the right: [6,7,1,2,3,4,5]

rotate 3 steps to the right: [5,6,7,1,2,3,4]

Code

```
/* Topic: Arrays
 * Question: Rotate Array * Given an array, rotate the array to the right by k
steps, where k is non-negative. */
#include <iostream>
#include <vector>

using namespace std;

void reverse(vector<int>&A, int start, int end){
    int n = A.size();

    int i = start;
    int j = end;

    while(i <= j){
        swap(A[i], A[j]);
        i++;
        j--;
    }
}

void rotate(vector<int>& nums, int k) {

    int N = nums.size();
```

```

    if(k == N){
        return;
    }
    if(k > N){
        k = k % N;
    }
    //Reverse whole array
    reverse(nums, 0, N-1);

    //Reverse first k elements
    reverse(nums, 0, k-1);

    //Reverse remaining
    reverse(nums, k, N-1);
}

void printArr(vector<int> &A){

    for(int i = 0; i < A.size(); i++){
        cout<<A[i]<<" ";
    }
    cout<<endl;
}

int main(){

    vector<int> arr1 = {1,2,3,4,5,6,7};
    vector<int> arr2 = {-1,-100,3,99};

    printArr(arr1);
    rotate(arr1, 3);
    cout<<"{1,2,3,4,5,6,7} rotated by 3: ";
    printArr(arr1);

    printArr(arr2);
    rotate(arr2, 2);
    cout<<"{-1,-100,3,99} rotated by 2: ";
    printArr(arr2);

    return 0;
}

```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
1 2 3 4 5 6 7
{1,2,3,4,5,6,7} rotated by 3: 5 6 7 1 2 3 4
-1 -100 3 99
{-1,-100,3,99} rotated by 2: 3 99 -1 -100

Process finished with exit code 0
```

Question 8: Two Sum

Given an array of integers `nums` and an integer `target`, return indices of the two numbers such that they add up to `target`.

You may assume that each input would have exactly one solution, and you may not use the same element twice.

You can return the answer in any order.

Example 1:

Input: `nums = [2,7,11,15]`, `target = 9`

Output: `[0,1]`

Explanation: Because `nums[0] + nums[1] == 9`, we return `[0, 1]`.

Code

```
/* Topic: Hashing
 * Question: Two Sum * Given an array of integers nums and an integer target, *
return indices of the two numbers such that they add up to target. */
#include <iostream>
#include <vector>
#include <unordered_map>

using namespace std;

vector<int> twoSum(vector<int>& nums, int target) {

    unordered_map<int,int> hmap;
    vector<int> result;

    for(int i = 0; i < nums.size(); i++){
```

```

        int look = target - nums[i];

        if(hmap.find(look) != hmap.end()){//if target-nums[i] exists in hashmap
            result.push_back(hmap[look]);
            result.push_back(i);
            break;
        }

        hmap[nums[i]] = i;
    }
    return result;
}

void printArr(vector<int> &A){

    for(int i = 0; i < A.size(); i++){
        cout<<A[i]<<" ";
    }
    cout<<endl;
}

int main() {

    vector<int> arr1 = {2,7,11,15};
    vector<int> arr2 = {3,2,4,5};
    vector<int> res1, res2;

    printArr(arr1);
    cout<<"Two Sum: ";
    res1 = twoSum(arr1,9);
    printArr(res1);

    printArr(arr2);
    cout<<"Two Sum: ";
    res2 = twoSum(arr2, 6);
    printArr(res2);

    return 0;
}

```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
2 7 11 15
Two Sum: 0 1
3 2 4 5
Two Sum: 1 2

Process finished with exit code 0
```

Question 9: Insert element in a Sorted List

Given a sorted linked list and a value to insert, write a function to insert the value in a sorted way

Code

```
/* Topic: Linked Lists
 * Question: Insert in a Sorted List * Given a linked list sorted in ascending
order and an integer called data, * insert data in the linked list such that the
list remains sorted. */
#include <iostream>
#include <vector>

using namespace std;

class Node {
public:
    int data;
    Node* next;
};

void sortedInsert(Node** head_ref,
                  Node* new_node)
{
    Node* current;
    /* Special case for the head end */
    if (*head_ref == NULL
        || (*head_ref)->data
            >= new_node->data) {
        new_node->next = *head_ref;
        *head_ref = new_node;
    }
    else {
```

```

        /* Locate the node before the
point of insertion */        current = *head_ref;
        while (current->next != NULL
                && current->next->data
                < new_node->data) {
            current = current->next;
        }
        new_node->next = current->next;
        current->next = new_node;
    }
}

```

```

Node* newNode(int new_data)
{
    /* allocate node */
    Node* new_node = new Node();

    /* put in the data */
    new_node->data = new_data;
    new_node->next = NULL;

    return new_node;
}

```

```

void printList(Node* head)
{
    Node* temp = head;
    while (temp != NULL) {
        cout << temp->data << " ";
        temp = temp->next;
    }
}

```

```

int main()
{
    /* Start with the empty list */
    Node* head = NULL;
    Node* new_node = newNode(5);
    sortedInsert(&head, new_node);
    new_node = newNode(10);
    sortedInsert(&head, new_node);
    new_node = newNode(7);
    sortedInsert(&head, new_node);
    new_node = newNode(3);
    sortedInsert(&head, new_node);
    new_node = newNode(1);
}

```

```

sortedInsert(&head, new_node);
new_node = newNode(9);
sortedInsert(&head, new_node);
cout << "Created Linked List\n";
printList(head);

return 0;
}

```

Output

```

/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
Created Linked List
1 3 5 7 9 10
Process finished with exit code 0

```

Question 10: Remove Duplicates from Sorted Array

Given an integer array `nums` sorted in non-decreasing order, remove the duplicates in-place such that each unique element appears only once. The relative order of the elements should be kept the same.

Since it is impossible to change the length of the array in some languages, you must instead have the result be placed in the first part of the array `nums`. More formally, if there are `k` elements after removing the duplicates, then the first `k` elements of `nums` should hold the final result. It does not matter what you leave beyond the first `k` elements.

Return `k` after placing the final result in the first `k` slots of `nums`.

Example 1:

Input: `nums = [1,1,2]`

Output: 2, `nums = [1,2,_____]`

Explanation: Your function should return `k = 2`, with the first two elements of `nums` being 1 and 2 respectively.

It does not matter what you leave beyond the returned `k` (hence they are underscores).

Code

```

/* Topic: Arrays
 * Question: Remove Duplicates from Sorted Array * Given an integer array nums
sorted in non-decreasing order, remove the duplicates in-place such that each
unique element appears only once. * The relative order of the elements should be
kept the same. */
#include <iostream>
#include <vector>

using namespace std;

int removeDuplicates(vector<int>& nums) {

    if(nums.size() == 1){
        return 1;
    }
    int i = 0;
    int j = 1;
    int k = 1;
    int n = nums.size();

    while(i < n && j < n){
        if(nums[i] == nums[j]){
            j++;
        }
        else{
            nums[i+1] = nums[j];
            i++;
            j++;
            k++;
        }
    }

    return k;

}

int main() {
    vector<int> arr = { 1, 1, 2, 2, 3, 5, 5, 6 };

    // Function calling
    cout<<"Number of elements after removing duplicates: "<<removeDuplicates(arr);
    return 0;
}

```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
Number of elements after removing duplicates: 5
Process finished with exit code 0
```

Question 11: Contains Duplicate

Given an integer array `nums`, return `true` if any value appears at least twice in the array, and return `false` if every element is distinct.

Example 1:

Input: `nums = [1,2,3,1]`

Output: `true`

Code

```
/* Topic: Hashing
 * Question: Contains Duplicate * Given an integer array nums, * return true if any
value appears at least twice in the array, * and return false if every element is
distinct. */
#include <iostream>
#include <vector>
#include <unordered_map>

using namespace std;

bool containsDuplicate(vector<int>& nums) {

    unordered_map<int,int> mymap;

Question 12: Reverse a Linked List

Given the head of a singly linked list, reverse the list, and return the reversed list.

Code

```

/* Topic: Linked List
 * Question: Reverse a Linked List * Given the head of a singly linked list,
reverse the list, and return the reversed list. */
#include <iostream>
#include <vector>

using namespace std;

```

```

struct ListNode {
    int val;
    ListNode *next;
    ListNode() : val(0), next(nullptr) {}
    ListNode(int x) : val(x), next(nullptr) {}
    ListNode(int x, ListNode *next) : val(x), next(next) {}
};

ListNode* reverseList(ListNode* head) {

    if(head == NULL || head->next == NULL){
        return head;
    }

    ListNode* prev = NULL;
    ListNode* temp = head;
    ListNode* curr;

    while(temp != NULL){
        curr = temp;
        temp = curr->next;
        curr->next = prev;
        prev = curr;
    }

    head = curr;

    return head;
}

void printLL(ListNode* head){
    if(head == NULL){
        cout<<"NULL";
        return;
    }
    ListNode* newnode = head;

    while(newnode!= NULL){
        cout<<newnode->val<<" ";
        newnode = newnode->next;
    }
}

int main(){

    ListNode* node1 = new ListNode(1);

```

```

ListNode* node2 = new ListNode(2);

Question 13: Reverse words in a string

Given an input string *s*, reverse the order of the words.

A word is defined as a sequence of non-space characters. The words in *s* will be separated by at least one space.

Return a string of the words in reverse order concatenated by a single space.

Input: s = "the sky is blue"

Output: "blue is sky the"

Code

```
/* Topic: Strings
 * Question: Reverse words in a string * Write a function that reverses a string. *
The input string is given as an array of characters. * You must do this by
modifying the input array in-place with O(1) extra memory. */
#include <iostream>
#include <string>

using namespace std;

string reverseWords(string s) {
    string word = "";
    string res = "";
    for (char i: s) {
        if (i == ' ') {
            res = word + " " + res;
            word = "";
        } else {
            word += i;
        }
    }
    res = word + " " + res;
    return res.substr(0, res.size() - 1);
}

int main(){
    string s1 = "the sky is blue";

    string res1 = reverseWords(s1);

    cout<<"Reverse of "<<s1<<":"<<res1;

    return 0;
}
```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
Reverse of the sky is blue:blue is sky the
Process finished with exit code 0
```

Question 14: Valid Anagram

Given two strings s and t, return true if t is an anagram of s, and false otherwise.

An Anagram is a word or phrase formed by rearranging the letters of a different word or phrase, typically using all the original letters exactly once.

Input: s = "anagram", t = "nagaram"

Output: true

Code

```
/* Topic: Strings
 * Question: Valid Anagram * Given two strings s and t, return true if t is an
anagram of s, and false otherwise. */#include <iostream>
#include <string>
#include <vector>

using namespace std;

bool isAnagram(string s, string t) {
    if (s.size() != t.size()) {
        return false;
    }

    vector<int> count(26);

    for (int i = 0; i < s.size(); i++) {
        count[s[i] - 'a']++;
    }

    for (int j = 0; j < t.size(); j++) {
        count[t[j] - 'a']--;
        if (count[t[j] - 'a'] < 0) {
            return false;
        }
    }
    return true;
}

int main(){
    string s1 = "nagaram";
    string s2 = "anagram";
```

```
(isAnagram(s1,s2))? cout<<"Yes" : cout<<"No";  
  
return 0;  
}
```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2  
Yes  
Process finished with exit code 0
```

Question 15: Remove Duplicate Letters

Given a string *s*, remove duplicate letters so that every letter appears once and only once. You must make sure your result is the smallest in lexicographical order among all possible results.

Example 1:

Input: *s* = "bcabc"

Output: "abc"

Example 2:

Input: *s* = "cbacdcbc"

Output: "acdb"

Code

```
/* Topic: Stacks  
 * Question: Remove Duplicate Letters * Given a string s, remove duplicate letters  
so that every letter appears once and only once. * You must make sure your result  
is the smallest in lexicographical order among all possible results */#include  
<iostream>  
#include <string>  
#include <vector>  
#include <stack>  
  
using namespace std;  
  
string removeDuplicateLetters(string s) {
```

```

vector<int> lastidx(26,0);
vector<bool> charseen(26,false);
stack<char> st;
string res = "";

for(int i = 0; i < s.length(); i++){
    lastidx[s[i] - 'a'] = i;
}

for(int i = 0; i < s.size(); i++){

    int curr = s[i] - 'a';

    if(charseen[curr]){
        continue;
    }

    while(st.size()!=0 && st.top() > s[i] && i < lastidx[st.top() - 'a']){
        charseen[st.top() - 'a'] = false;
        st.pop();
    }

    st.push(s[i]);
    charseen[curr] = true;

}

while(!st.empty()){
    res += st.top();
    st.pop();
}

reverse(res.begin(), res.end());

return res;

}

int main(){
    string s1 = "cbacdbc";

    cout<<removeDuplicateLetters(s1);

```

```
    return 0;  
}
```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2  
acdb  
Process finished with exit code 0
```

Question 16: Pow(x, n)

Implement `pow(x, n)`, which calculates x raised to the power n (i.e., x^n).

Example 1:

Input: $x = 2.00000$, $n = 10$

Output: 1024.00000

Example 2:

Input: $x = 2.10000$, $n = 3$

Output: 9.26100

Code

```
/* Topic: Recursion  
 * Question: Pow(x, n) * Implement pow(x, n), which calculates x raised to the  
power n (i.e.,  $x^n$ ). */  
#include <iostream>  
#include <cmath>  
  
using namespace std;  
  
double myPow(double x, int n) {  
  
    if(n < 0) {  
        x = 1 / x;  
    }  
  
    long num = labs(n);  
  
    double pow = 1;
```

```

    while(num){ // equivalent to while(num != 0)
        if(num & 1) { // equivalent to if((num & 1) != 0)
            pow *= x;
        }

        x *= x;
        num >>= 1;
    }

    return pow;
}

int main(){
    int x = 2.00000;
    int n = 10;

    cout<<myPow(x, n);
}

```

Output

```

/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
1024
Process finished with exit code 0

```

Question 17: Implement Stack Using Queue

Implement a last-in-first-out (LIFO) stack using only two queues. The implemented stack should support all the functions of a normal stack (push, top, pop, and empty).

Code

```

/* Topic: Queues
 * Question: Implement Stack Using Queues * Implement a last-in-first-out (LIFO)
stack using only two queues. * The implemented stack should support all the
functions of a normal stack (push, top, pop, and empty). */
#include <iostream>
#include <queue>

using namespace std;

```

```

class Stack {
    queue<int> q;
public:
    void push(int data);
    void pop();
    int top();
    int size();
    bool empty();
};

void Stack::push(int data)
{
    // Get previous size of queue
    int s = q.size();

    // Push the current element
    q.push(data);

    // Pop all the previous elements and put them after
    // current element
    for (int i = 0; i < s; i++) {
        // Add the front element again
        q.push(q.front());

        // Delete front element
        q.pop();
    }
}

void Stack::pop()
{
    if (q.empty())
        cout << "No elements\n";
    else
        q.pop();
}

// Returns top of stack
int Stack::top() {
    return (q.empty()) ? -1 : q.front();
}

// Returns true if Stack is empty else false
bool Stack::empty() {
    return (q.empty());
}

```

```

int Stack::size(){
    return q.size();
}

int main()
{
    Stack st;
    st.push(1);
    st.push(2);
    st.push(3);
    cout << "current size: " << st.size() << "\n";
    cout << "Pop "<<st.top() << "\n";
    st.pop();
    cout << "Pop "<<st.top() << "\n";
    st.pop();
    cout << "Pop "<<st.top() << "\n";
    cout << "current size: " << st.size();
    return 0;
}

```

Output

```

/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
current size: 3
Pop 3
Pop 2
Pop 1
current size: 1
Process finished with exit code 0

```

Question 18: Insertion Sort List

Given the head of a singly linked list, sort the list using insertion sort, and return the sorted list's head.

Code

```

/* Topic: Sorting Techniques
 * Question: Insertion Sort List * Given the head of a singly linked list, * sort
the list using insertion sort, and return the sorted list's head. */

```

```
#include <iostream>
#include <vector>

using namespace std;

struct Node {
    int val;
    struct Node* next;
    Node(int x)
    {
        val = x;
        next = NULL;
    }
};

class LinkedlistIS {

public:
    Node* head;
    Node* sorted;

    void push(int val)
    {

        Node* newnode = new Node(val);
        newnode->next = head;
        head = newnode;
    }

    void insertionSort(Node* headref)
    {
        sorted = NULL;
        Node* current = headref;

        while (current != NULL) {

            Node* next = current->next;
            sortedInsert(current);
            current = next;
        }
        head = sorted;
    }

    void sortedInsert(Node* newnode)
    {
        if (sorted == NULL || sorted->val >= newnode->val) {
```

```

        newnode->next = sorted;
        sorted = newnode;
    }
    else {
        Node* current = sorted;
        while (current->next != NULL
                && current->next->val < newnode->val) {
            current = current->next;
        }
        newnode->next = current->next;
        current->next = newnode;
    }
}

void printlist(Node* head)
{
    while (head != NULL) {
        cout << head->val << " ";
        head = head->next;
    }
}

};

int main()
{
    LinkedlistIS list;
    list.head = NULL;

    list.printlist(list.head);
    cout << endl;
    list.insertionSort(list.head);
    cout << "After Sorting:" << endl;
    list.printlist(list.head);

    return 0;
}

```

Output

```
/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
Before Sorting:
30 3 4 20 5
After Sorting:
3 4 5 20 30
Process finished with exit code 0
```

Question 19: Sort an Array

Given an array of integers nums, sort the array in ascending order and return it.

You must solve the problem without using any built-in functions in $O(n\log(n))$ time complexity and with the smallest space complexity possible.

Code

```
/* Topic: Heap/Priority Queues
 * Question: Sort an Array * Given an array of integers nums, sort the array in
ascending order and return it. * You must solve the problem without using any
built-in functions * in  $O(n\log(n))$  time complexity and with the smallest space
complexity possible. */
#include <iostream>
#include <vector>

using namespace std;

void heapify(vector<int>&nums,int n,int i){
    int l=2*i+1;
    int r=2*i+2;
    int lar=i;

    if(l<n && nums[l]>nums[lar])
        lar=l;
    if(r<n && nums[r]>nums[lar])
        lar=r;

    if(lar!=i){
        swap(nums[lar],nums[i]);
        heapify(nums,n,lar);
    }
}
```

```

void buildheap(vector<int>&nums,int n){
    for(int i=(n-2)/2;i>=0;i--){
        heapify(nums,n,i);
    }
}

void heapsort(vector<int>&nums,int n){
    buildheap(nums,n);

    for(int i=n-1;i>=0;i--){
        swap(nums[i],nums[0]);
        heapify(nums,i,0);
    }
}

vector<int> sortArray(vector<int>& nums) {
    heapsort(nums,nums.size());
    return nums;
}

void printarr(vector<int>&A){
    for(int i = 0; i < A.size(); i++){
        cout<<A[i]<<" ";
    }
    cout<<endl;
}

int main(){
    vector<int> nums = {5,1,1,2,0,0,7};
    vector<int> res;

    cout<<"Before:";
    printarr(nums);
    res = sortArray(nums);
    cout<<"After:";
    printarr(res);

    return 0;
}

```

Output

```

/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
Before:5 1 1 2 0 0 7
After:0 0 1 1 2 5 7

```

Question 20: Find if Path Exists in Graph

There is a bi-directional graph with n vertices, where each vertex is labeled from 0 to $n - 1$ (inclusive). The edges in the graph are represented as a 2D integer array `edges`, where each `edges[i] = [ui, vi]` denotes a bi-directional edge between vertex `ui` and vertex `vi`. Every vertex pair is connected by at most one edge, and no vertex has an edge to itself.

You want to determine if there is a valid path that exists from vertex `source` to vertex `destination`.

Given `edges` and the integers `n`, `source`, and `destination`, return `true` if there is a valid path from `source` to `destination`, or `false` otherwise.

Code

```
/* Topic: Graphs
 * Question: Find if Path Exists in Graph * determine if there is a valid path that
exists from vertex source to vertex destination. */
#include <iostream>
#include <vector>
#include <queue>

using namespace std;

bool validPath(int n, vector<vector<int>>& edges, int start, int end) {
    vector<vector<int>> graph(n);
    // Build the graph
    for(int i=0; i<edges.size(); i++) {
        graph[edges[i][0]].push_back(edges[i][1]);
        graph[edges[i][1]].push_back(edges[i][0]);
    }

    // BFS
    queue<int> q;
    vector<int> visited(n, 0);
    q.push(start);
    visited[start] = 1;
    while(!q.empty()){
        int top = q.front();
        q.pop();
        if(top == end)
            return true;

        for(int i=0; i<graph[top].size(); i++){
```

```

        if(visited[graph[top][i]] == 0){
            q.push(graph[top][i]);
            visited[graph[top][i]] = 1;
        }
    }
}
return false;
}

int main(){
    return 0;
}

```

Output

Accepted Runtime: 2 ms

Your input	3 [[0,1],[1,2],[2,0]] 0
Output	true
Expected	true

Question 21: Merge Sorted Array

You are given two integer arrays `nums1` and `nums2`, sorted in non-decreasing order, and two integers `m` and `n`, representing the number of elements in `nums1` and `nums2` respectively.

Merge `nums1` and `nums2` into a single array sorted in non-decreasing order.

The final sorted array should not be returned by the function, but instead be stored inside the array `nums1`. To accommodate this, `nums1` has a length of `m + n`, where the first `m` elements denote the elements that should be merged, and the last `n` elements are set to 0 and should be ignored. `nums2` has a length of `n`.

Example 1:

Input: `nums1 = [1,2,3,0,0,0]`, `m = 3`, `nums2 = [2,5,6]`, `n = 3`

Output: `[1,2,2,3,5,6]`

Explanation: The arrays we are merging are `[1,2,3]` and `[2,5,6]`.

The result of the merge is `[1,2,2,3,5,6]` with the underlined elements coming from `nums1`.

Code

```
/* Topic: Sorting
 * Question: Merge Sorted Array * You are given two integer arrays nums1 and nums2,
sorted in non-decreasing order, * and two integers m and n, representing the number
of elements in nums1 and nums2 respectively. * Merge nums1 and nums2 into a single
array sorted in non-decreasing order. * The final sorted array should not be
returned by the function, * but instead be stored inside the array nums1. * To
accommodate this, nums1 has a length of m + n, * where the first m elements denote
the elements that should be merged, * and the last n elements are set to 0 and
should be ignored. nums2 has a length of n. */
#include <iostream>
#include <vector>

using namespace std;

void merge(vector<int>& nums1, int m, vector<int>& nums2, int n) {
    int i=m-1,j=n-1,k=m+n-1;
    while(i>=0&&j>=0)
    {
        if(nums1[i]>nums2[j])
        {
            nums1[k--]=nums1[i--];
        }
        else
        {
            nums1[k--]=nums2[j--];
        }
    }

    while(j>=0){
        nums1[k--]=nums2[j--];
    }
}

void printarr(vector<int>&A){
    for(int i = 0; i < A.size(); i++){
        cout<<A[i]<<" ";
    }
    cout<<endl;
}

int main(){
    vector<int>nums1 = {1,2,3,0,0,0};
```

```

vector<int>nums2 = {2,5,6};

int m = nums1.size() - nums2.size();
int n = nums2.size();
printarr(nums1);
printarr(nums2);
merge(nums1, m, nums2, n);
printarr(nums1);

return 0;
}

```

Output

```

/Users/antheaabreo/CLionProjects/dsa_a2/cmake-build-debug/dsa_a2
1 2 3 0 0 0
2 5 6
1 2 2 3 5 6

```

Question 22: Search in Rotated Sorted Array

There is an integer array `nums` sorted in ascending order (with distinct values).

Prior to being passed to your function, `nums` is possibly rotated at an unknown pivot index `k` ($1 \leq k < \text{nums.length}$) such that the resulting array is `[nums[k], nums[k+1], ..., nums[n-1], nums[0], nums[1], ..., nums[k-1]]` (0-indexed). For example, `[0,1,2,4,5,6,7]` might be rotated at pivot index 3 and become `[4,5,6,7,0,1,2]`.

Given the array `nums` after the possible rotation and an integer `target`, return the index of `target` if it is in `nums`, or `-1` if it is not in `nums`.

You must write an algorithm with $O(\log n)$ runtime complexity.

Example 1:

Input: `nums = [4,5,6,7,0,1,2]`, `target = 0`

Output: 4

Code

/* Topic: Searching

* Question: Search in Rotated Sorted Array There is an integer array nums sorted in ascending order (with distinct values).

Prior to being passed to your function,

nums is possibly rotated at an unknown pivot index k ($1 \leq k < \text{nums.length}$) such that the resulting array is [nums[k], nums[k+1], ..., nums[n-1], nums[0], nums[1], ..., nums[k-1]] (0-indexed).

For example, [0,1,2,4,5,6,7] might be rotated at pivot index 3 and become [4,5,6,7,0,1,2].

Given the array nums after the possible rotation and an integer target, return the index of target if it is in nums, or -1 if it is not in nums.

*/

```
#include <iostream>
```

```
#include <vector>
```

```
using namespace std;
```

```
int binarySearch(vector<int>&A, int l, int r, int target){  
    int mid;
```

```
    while(l <= r){  
        mid = l + (r-l)/2;
```

```
        if(A[mid] == target){  
            return mid;
```

```
        }

Question 23: Maximum Depth of Binary Tree

Given the root of a binary tree, return its maximum depth.

A binary tree's maximum depth is the number of nodes along the longest path from the root node down to the farthest leaf node.

Code

```
/* Topic: Tree
Given the root of a binary tree, return its maximum depth.
A binary tree's maximum depth is the number of nodes along the longest path from
the root node down to the farthest leaf node.
*/

class TreeNode {
    int val;
    TreeNode left;
    TreeNode right;

    TreeNode() {
    }

    TreeNode(int val) {
        this.val = val;
    }

    TreeNode(int val, TreeNode left, TreeNode right) {
        this.val = val;
        this.left = left;
        this.right = right;
    }
}

class Solution23 {
```

```

private int depth;

private void calculateDepth(TreeNode root, int d) {
    if (root == null) {
        return;
    }
    if (d > depth) {
        depth = d;
    }
    calculateDepth(root.left, d + 1);
    calculateDepth(root.right, d + 1);
}

public int maxDepth(TreeNode root) {
    depth = 0;
    calculateDepth(root, 1);
    return depth;
}
}

public class Q23 {
    public static void main(String[] args) {
        Solution23 solution = new Solution23();
        TreeNode root = new TreeNode(
            3,
            new TreeNode(9),
            new TreeNode(
                20,
                new TreeNode(15),
                new TreeNode(7)
            )
        );
        int depth = solution.maxDepth(root);
        System.out.println("Max depth: " + depth);
    }
}

```

Output

```
Max depth: 3
```

```
Process finished with exit code 0
```

Question 24: Four Sum

Given an array `nums` of `n` integers, return an array of all the unique quadruplets `[nums[a], nums[b], nums[c], nums[d]]` such that:

$0 \leq a, b, c, d < n$

`a`, `b`, `c`, and `d` are distinct.

`nums[a] + nums[b] + nums[c] + nums[d] == target`

You may return the answer in any order.

Code

```
/* Topic: Arrays
Given an array nums of n integers, return an array of all the unique quadruplets
[nums[a], nums[b], nums[c], nums[d]] such that:

0 <= a, b, c, d < n
a, b, c, and d are distinct.
nums[a] + nums[b] + nums[c] + nums[d] == target
You may return the answer in any order.
*/

Question 31: Shortest Path with Alternating Colors

You are given an integer n , the number of nodes in a directed graph where the nodes are labeled from 0 to $n - 1$. Each edge is red or blue in this graph, and there could be self-edges and parallel edges.

You are given two arrays `redEdges` and `blueEdges` where:

`redEdges[i] = [ai, bi]` indicates that there is a directed red edge from node a_i to node b_i in the graph, and

`blueEdges[j] = [uj, vj]` indicates that there is a directed blue edge from node u_j to node v_j in the graph.

Return an array `answer` of length n , where each `answer[x]` is the length of the shortest path from node 0 to node x such that the edge colors alternate along the path, or -1 if such a path does not exist.

Code

```

/* Topic: Graph
You are given an integer n, the number of nodes in a directed graph where the nodes

```

are labeled from 0 to $n - 1$. Each edge is red or blue in this graph, and there could be self-edges and parallel edges.

You are given two arrays `redEdges` and `blueEdges` where:

`redEdges[i] = [ai, bi]` indicates that there is a directed red edge from node `ai` to node `bi` in the graph, and

        Solution39 solution = new Solution39();
        int[] ans = solution.findDiagonalOrder(new int[][]{new int[]{1, 2, 3}, new
int[]{4, 5, 6}, new int[]{7, 8, 9}});
        System.out.println("Diagonal traversal: " + Arrays.toString(ans));
    }
}

```

Output

```
Diagonal traversal: [1, 2, 4, 7, 5, 3, 6, 8, 9]
```

```
Process finished with exit code 0

Question 40: Swap Nodes in Pairs

Given a linked list, swap every two adjacent nodes and return its head. You must solve the problem without modifying the values in the list's nodes (i.e., only nodes themselves may be changed.)

Example 1:

Input: head = [1,2,3,4]

Output: [2,1,4,3]

Code

```
/* Topic: Linked list
Given a linked list, swap every two adjacent nodes and return its head. You must
solve the problem without modifying the values in the list's nodes (i.e., only
nodes themselves may be changed.)
*/

class ListNode {
    int val;
    ListNode next;

    ListNode() {
    }

    ListNode(int val) {
        this.val = val;
    }
}
```

```

    }

    ListNode(int val, ListNode next) {
        this.val = val;
        this.next = next;
    }
}

class Solution40 {
    public ListNode swapPairs(ListNode head) {
        if (head == null) {
            return null;
        }

        ListNode ptr = head;
        ListNode ptr2 = head.next;
        ListNode prev = null;
        if (ptr2 != null) {
            head = head.next;
        }

        while (ptr2 != null) {
            ptr.next = ptr2.next;
            if (prev == null) {
                ptr2.next = ptr;
            } else {
                prev.next = ptr2;
                ptr2.next = ptr;
            }

            prev = ptr;
            ptr = ptr.next;
            if (ptr == null) {
                break;
            }
            ptr2 = ptr.next;
        }

        return head;
    }
}

public class Q40 {
    public static void main(String[] args) {
        Solution40 solution = new Solution40();
        ListNode n1 = new ListNode(1, new ListNode(2, new ListNode(3, new

```

```
ListNode(4)))));
    ListNode ans = solution.swapPairs(n1);
    System.out.println("Swapped linked list: ");
    while (ans != null) {
        System.out.print(ans.val + " -> ");
        ans = ans.next;
    }
    System.out.println("null");
}
}
```

Output

```
Swapped linked list:
2 → 1 → 4 → 3 → null

Process finished with exit code 0
```
